

HAND SAFETY

A HANDY STUDY GUIDE

INTRODUCTION

Hands are involved in nearly one-third of job-site injuries.

At Chargie, our hands install chargers, drill concrete, mount brackets, secure conduit, and load vans. Most hand injuries happen during routine tasks — when focus slips.

Hand protection is simple. Awareness is critical. This module covers common hazards and how to prevent them.

WHY IT MATTERS

- Hands are used on every task
- Injuries stop productivity
- Many injuries are preventable
- Damage can happen in seconds

If hands are hurt — work stops.

WHEN HANDS ARE AT RISK

Sharp Edges

- Metal brackets
- Unistrut
- Panel edges
- Cut conduit

Pinch & Crush Points

- Van sliding doors
- Ladders
- Between charger and wall
- Pipe clamps
- Material shifting in racks

Power Tools

- Broken drill bits
- Impact driver slips
- Grinder kickback
- Hole saw bind-up

Blades & Knives

- Opening packaging
- Cutting zip ties
- Stripping wire
- Trimming materials

If it can cut, pinch, or crush — protect first.

WHAT DAMAGE LOOKS LIKE

 Cuts and lacerations

 Crushed fingers

 Puncture wounds

 Lost work time

Small mistake. Big impact.

HOW TO PREVENT HAND INJURIES

Stop. Think. Before every task.

- What could cut me?
- What could pinch me?
- What could crush me?
- Do I need gloves?
- Is there a safer way to hold this?

Five seconds of thinking prevents weeks of healing.

GLOVES

Gloves help prevent:

- Abrasions
- Minor cuts
- Light impact

Must fit properly.
Must match the task.

Loose gloves + rotating tools = hazard.

FIELD CHECKLIST

- Sharp edges identified
- Materials secured
- Correct gloves available
- Power tools inspected
- Hands clear of pinch points
- READY TO WORK

PROTECT YOUR HANDS

YOU USE THEM EVERY DAY
