

PARKING LOT SAFETY

A STUDY GUIDE ON PAYING ATTENTION

INTRODUCTION

Introduction

Parking lots are high-traffic hazard zones where multi-ton vehicles and pedestrians occupy the same narrow corridors. At Chargee, our team navigates these spaces every day to access sites, unload equipment, and move between chargers.

Most lot incidents happen during routine transits—when focus slips and the phone comes out. Awareness is critical.

WHY IT MATTERS

- Lots are used on every single site visit.
- Pedestrians are nearly invisible to reversing vehicles.
- Distractions cause 60% of parking lot collisions.

If an incident happens—work stops and injuries follow.

WHEN YOU ARE AT RISK

Reversing Vehicles

- White reverse lights
- Blind spots in large vans
- Vehicles backing out of stalls

Distracted Walking

- Checking work orders on phone
- Wearing earbuds in the lot
- Rushing to the equipment van

Environmental Factors

- Low-light site arrivals
- Tight maneuvers near pedestals
- Shifting materials in the van

Pedestrian Zones

- Walking between parked cars
- Crossing behind active engines
- Ignoring designated walkways

If it moves, shifts, or rolls—protect first.

THE COST OF A SLIP

- Pedestrian vs. Vehicle collisions
- Slips, trips, and falls on grease or ice
- Property damage to company vans
- Lost work time and insurance claims

Small mistake. Big impact.

HOW TO PREVENT LOT INCIDENTS

Stop. Think. Clean before you leave.

- Does that driver see me? (Establish eye contact)

- Is my phone put away?
- Did I back into my parking stall? (Forward exit is safer)

Five seconds of thinking prevents weeks of healing.

FIELD CHECKLIST

- Surroundings scanned for moving vehicles
- Designated walkways identified
- Phone secured in pocket
- Eye contact made with drivers
- Hands clear of van sliding doors

READY TO WORK

DRIVE SLOW AND MOVE FAST

WE DONT WANT TO BREAK THINGS
